Hi Daniel,

(Last & Longest email of the day)

Please find attached the Business Registry Operating Rules Questionnaire.

This questionnaire is needed so that we can refine the registry beyond the current foundation that has already been built. The next stage is to define exactly how the registry must behave when real company records are added, searched, displayed, claimed, corrected, used in workflows, and later made available through institutional/API use.

The questions are deliberately practical. We need clear operating rules, not broad concepts, so that the next build can be implemented safely and consistently across:

- company search;
- company profiles;
- data visibility;
- public versus admin-only fields;
- claim and authority workflows;
- bank-detail status;
- API use;
- duplicate handling;
- data disputes;
- client-safe readiness.

This is important because once real company data is added, the platform must not accidentally show something as verified, public, claimable, API-ready, or institutionally usable unless the correct rules and approval gates support that.

Please answer each question as directly as possible in the response spaces provided. Where a question asks for a rule, please give the actual rule you want the system to follow.

Josh
